**To be considered by OWASA, responses to this RFO must be received by 2:00 p.m. Eastern Time on Wednesday, August 4, 2021. Refer to Section 5 – Submittal Requirements for details.**

### **2. OBJECTIVES**

The primary objective of the project is the:

- a) Rehabilitation of existing Clearwell structure, including, but not limited to concrete roof and cracking, overflow pipe replacement, baffles and supports, locate and repair leaks known to existing, but not located during prior dive inspection.
- b) Rehabilitation of Flash Mix facility, including, but not limited to butterfly valves, chemical injection, slide gates, concrete and coatings, and rapid mixers.

### **3. BACKGROUND AND DESCRIPTION**

#### Clearwell

The Clearwell is a partially buried, cast-in-place concrete tank constructed circa 1948. The tank measures approximately 100-feet x 140-feet and 18-ft tall and serves as the WTP Finish Water (FW) reservoir. Baffle curtains create a stream flow for the purpose of improved chemical disinfection contact time prior to the FW leaving the WTP. In 1993, a 3-inch lightweight concrete topping was added on top of the Clearwell roof slab to improve the watertightness of the finished water reservoir. Other modifications and additions have been made to the Clearwell, which are further detailed in the Hazen and Sawyer (Hazen) memorandum.

From January to February 2020, under the supervision of Hazen, In-Water Services (IWS)

## **WTP Electrical Distribution Improvements**

*September 12, 2019*

completed an underwater dive inspection of the existing Clearwell. During this same period, dive Hazen also conducted an interior visual inspection of the non-submerged Clearwell areas. These inspections were performed to assess the condition of the Clearwell structure, submerged valves and piping, vents, other appurtenances, and locate leaks. While the inspections were not able to confirm the location of leaks, key areas were identified for rehabilitation, such as the roof.

Subsequent to these inspections, in May 2021, a significant amount of water was encountered during Subsurface Utility Engineering (SUE) exploratory test pit excavations adjacent to and an electrical manhole (MH) in close proximity to the Clearwell. Water samples were tested from one test pit and the MH with the results clearly identifying the water as Finish Water (FW). Therefore, locating and repairing leaks to mitigate the loss of FW from and mitigate the potential of infiltration of ground water into the Clearwell.

### Flash Mix

The Flash Mix facility a mostly above ground, cast-in-place partitioned concrete tank constructed in 1988. It consists of two, parallel trains separated by slide gates. Upstream isolation valves direct flow from three raw water pipelines (one from Cane Creek Reservoir and two from University Lake). Normal operation directs flow through one train; however, the original Flash Mix facility design was based on the operation of both trains to achieve a maximum production rate of 20 MGD.

From December 2017 to February 2018, Hazen completed a comprehensive assessment of Flash Mix process, including review of mixing technology, and sampling and chemical feed locations, and replacement of leaking flash mix isolation valves, investigating existing flash mix conditions, and evaluating design alternatives. Identified were several recommendations for improvements to the Flash Mix facility and process, which are detailed in the Hazen memorandum.
